# CONTENTS

- What is green software (engineering)?
- Hardware + software + user = ?
- Existing tools
- Selected topics
- Examples on ST
- Conclusions
- Future of GSE

# GREEN SOFTWARE ENGINEERING

Green software engineering is a branch of software engineering focusing on energy aspects of software. Please note that software plays here the role of the process, which one's energy consumption can be expressed through the energy consumption of all hardware parts that were used in any way by the examined process. Therefore, when evaluating software greenness, we always examine the usage load on hardware parts during software execution time.

# THE ROLE OF HARDWARE

- Display
- Networking (Wi-Fi, Bluetooth), radio
- Processor
- Memory
- Disks
- Battery
- Sensors

# THE ROLE OF SOFTWARE

- Operating system (difference between Windows, Linux, macOS, Android, iOS)
- Working software
- Computer games
- Application systems
- Databases

# THE ROLE OF THE USER

- The user “drives” the software
- Needs individual training (unlike HW/SW)
- Does (s)he receive it? Where?
- Repairing bad configuration is often done by buying a new device...

# EXISTING TOOLS

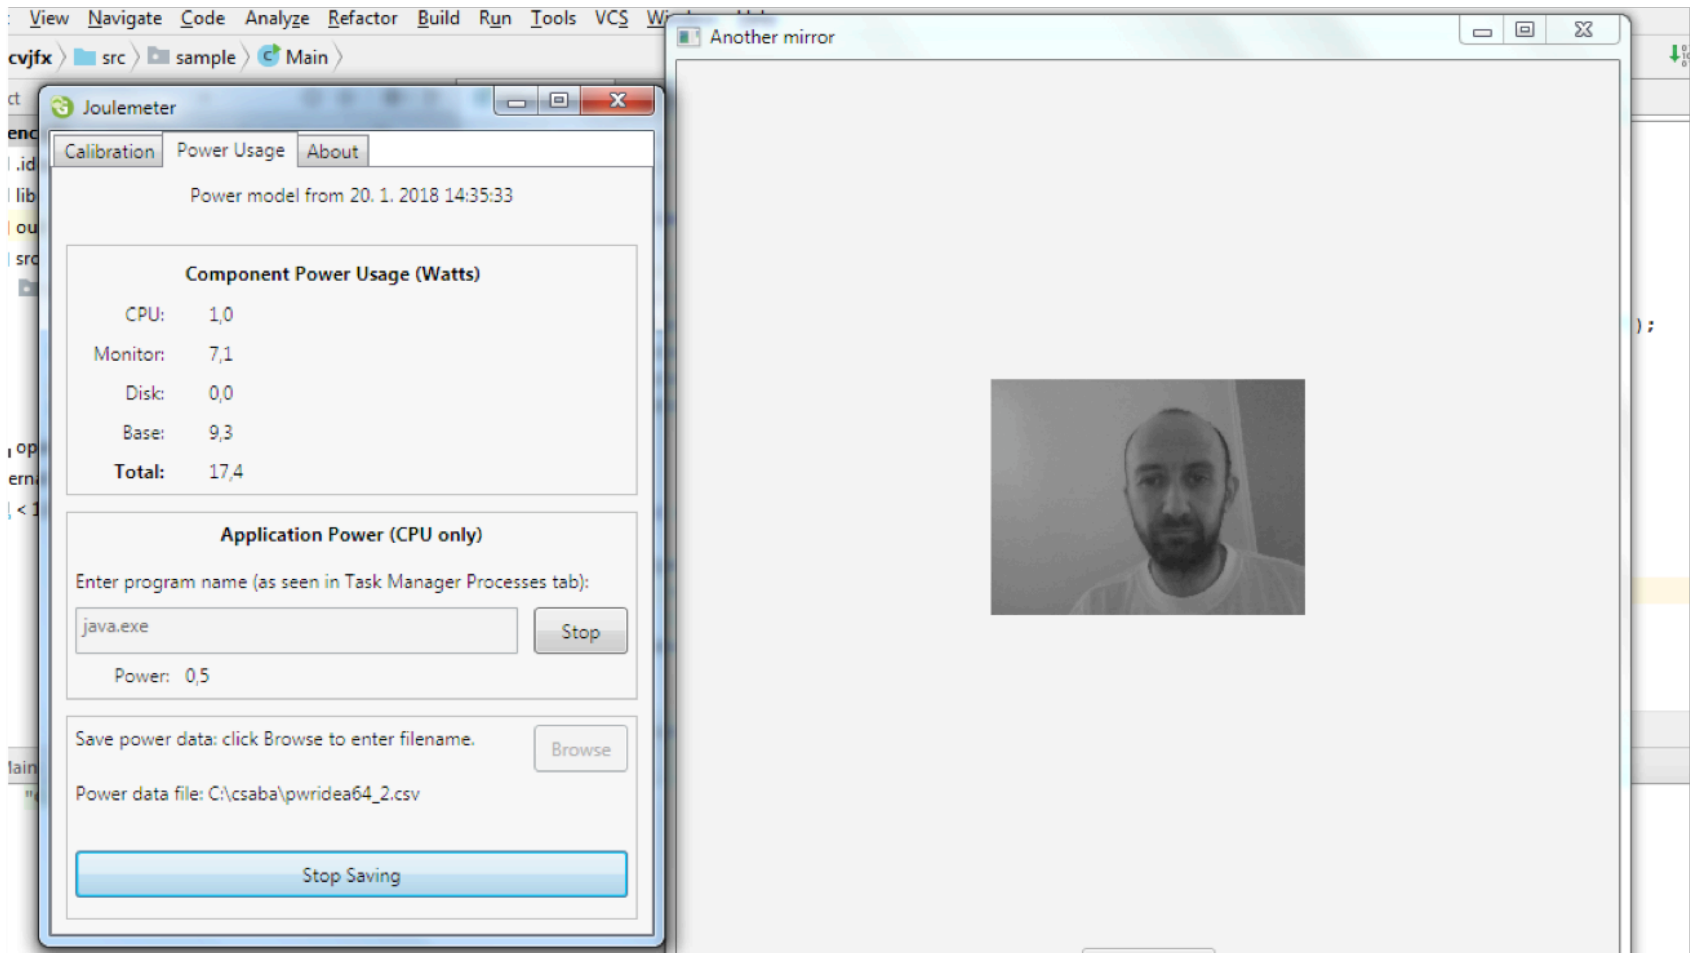

- OS-level (top, activity/process monitor, energy saver)
- For developers (Intel RAPL, GreenDroid, Microsoft Joulemeter, Android Studio, Xcode Debug Navigator, Instruments)
- User-space (powermetrics, powertop, Trepn profiler, Intel Power Gadget, Greenify, coffeinate)

# TOPIC SELECTION

- In-development measurement
- Post-development measurement
- Measuring third-party SW
- How does the energy profile of the software development process look like
- Distributed applications measurement

# EXAMPLE 1: IN-DEVELOPMENT MEASURING (INTELLECTUAL OUTPUT 1,2 OF THE ERASMUS+ PROJECT 2017-1-SK01-KA203-035402)

The screenshot displays an IDE interface with two windows. The 'Joulemeter' window is in the foreground, showing power usage data. The 'Another mirror' window is in the background, displaying a video feed of a man.

**Joulemeter**

Calibration | Power Usage | About

Power model from 20. 1. 2018 14:35:33

Component Power Usage (Watts)	
CPU:	1,0
Monitor:	7,1
Disk:	0,0
Base:	9,3
<b>Total:</b>	<b>17,4</b>

**Application Power (CPU only)**

Enter program name (as seen in Task Manager Processes tab):

Power: 0,5

Save power data: click Browse to enter filename.

Power data file: C:\csaba\pwridea64\_2.csv

**Another mirror**

Video feed of a man.

# EXAMPLE 1: IN-DEVELOPMENT MEASURING (INTELLECTUAL OUTPUT 1,2 OF THE ERASMUS+ PROJECT 2017-1-SK01-KA203-035402)

## EXAMPLE 2: POST-DEVELOPMENT MEASURING

- As part of black-box testing
- Acceptance criteria
- Performed manually or automatically

# EXAMPLE 2: POST-DEVELOPMENT MEASURING

Fig. 5. Comparing (a) no image caching image caching vs (b) image caching concerning energy consumption

Fig. 6. Comparing (a) no image caching vs (b) image caching concerning network traffic

Fig. 7. Comparing (a) no image caching vs (b) image caching concerning memory usage

# EXAMPLE 2: POST-DEVELOPMENT MEASURING

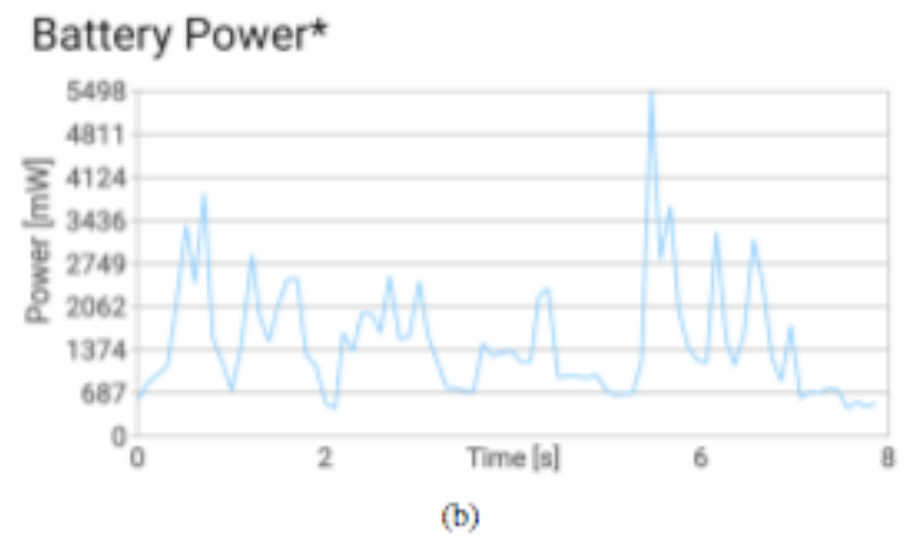

Fig. 5. Comparing (a) no image caching image caching vs (b) image caching concerning energy consumption

# EXAMPLE 2: POST-DEVELOPMENT MEASURING

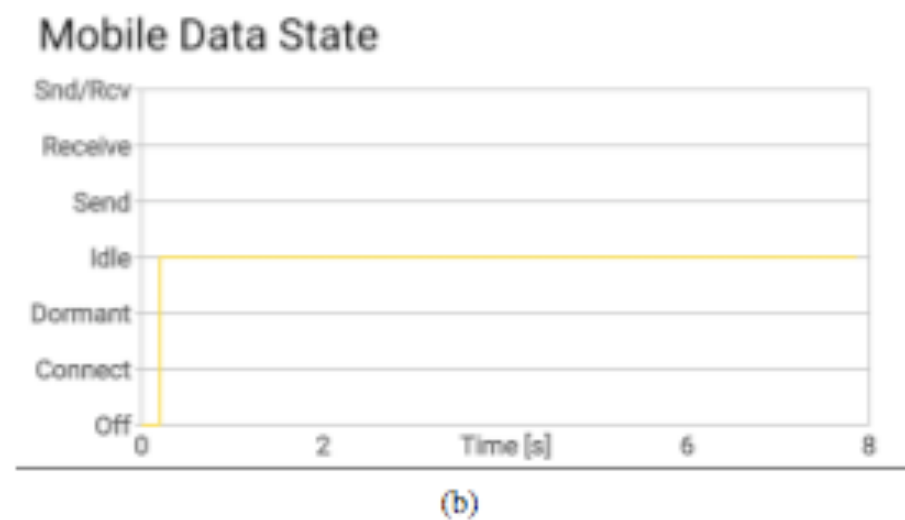

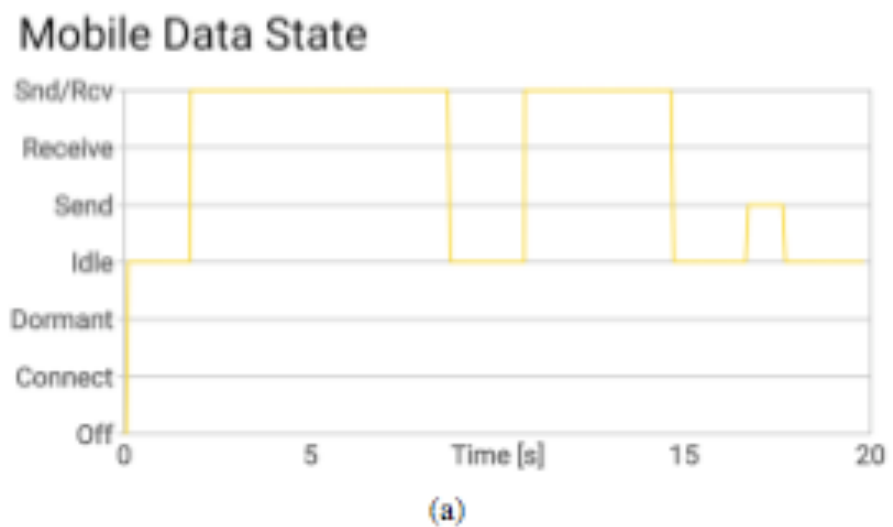

Fig. 6. Comparing (a) no image caching vs (b) image caching concerning network traffic

## EXAMPLE 3: MEASURING THIRD-PARTY SOFTWARE (INTELLECTUAL OUTPUT 1 OF THE ERASMUS+ PROJECT 2017-1-SK01-KA203-035402)

- To select the best performing alternative (for development or use)
- Preparing energy benchmarks

# EXAMPLE 3: MEASURING THIRD-PARTY SOFTWARE (INTELLECTUAL OUTPUT 1 OF THE ERASMUS+ PROJECT 2017-1-SK01-KA203-035402)

# EXAMPLE 3: MEASURING THIRD-PARTY SOFTWARE (INTELLECTUAL OUTPUT 1 OF THE ERASMUS+ PROJECT 2017-1-SK01-KA203-035402)

Disk [W]

## EXAMPLE 4: MEASURING THE (SIMPLE) DEVELOPMENT PROCESS

- Starting/ending when starting/ending to work
- Considering short breaks as well
- Useful as topic at retrospective meetings and analysis

# EXAMPLE 4: MEASURING THE (SIMPLE) DEVELOPMENT PROCESS

## EXAMPLE 5: MEASURING DISTRIBUTED APPLICATIONS

- All nodes running the application
- Communication network
  
- Distributed testing
- Performance testing
- User profiles

# WHAT TO DO WITH THE MEASUREMENTS' RESULTS?

- E1 application energy consumption: 2.19 Ws
- E2 in total, image caching consumes about 50% less energy because it is 60% faster, even that there are moments it is consuming more energy
- E3 disk operations' energy consumption: 1.35 Ws, total energy consumption: 1771.03 Ws
- E4 IDE energy consumption: 74.72 Ws
- E4/5 total host system energy consumption: 1983.28 Ws

# WHAT TO DO WITH THE MEASUREMENTS' RESULTS?

- Setting up the OS
- Uninstalling bad performing apps
- Fine-tuning the HW/SW/USR ecosystem
- SW evolution
- Software quality measurements
- Project planning to avoid high energy peaks

# RECAPITULATION

- In-development (OpenCV+JavaFX+Joulemeter)
- Post-development (Android app+Trepn)
- Measuring third-party sw (IntelliJ IDEA install app+Joulemeter)
- How does the energy profile of the software development process look like (Chrome+IntelliJ+JavaFX SceneBuilder+developed app)
- Distributed applications (clients+servers+route)

# FUTURE WORK IN GREEN SOFTWARE ENGINEERING

- Research:
  - Unification of principles
  - Standardization of representation of results
  - Software energy efficiency (label?)
- Industry:
  - Scaling over the path “single developer -> team -> management (project) -> company maturity”
- Academia:
  - Prepare this future by educating the people
